

TIRGEO

Connected Civil Operations

A high-level platform architecture
for safer, faster and more accountable delivery

SALES AND CUSTOMER CONVERSATIONS

Architecture snapshot - 3 July 2026

One operating system for the civil contractor

TirGeo connects what happened on site, who approved it, what plant was safe to use, what the contract required, and what payroll needs next.

CAPTURE ONCE

Work is recorded where it happens.

Hours, plant, safety and daily delivery evidence stay attached to the project.

APPROVE FASTER

Sign together or remotely.

Employees and supervisors can sign the same timecard on one phone or respond later.

STAY READY

Know what is missing.

Assigned safety evidence, tender checklists and workflow status make the next action visible.

Less chasing. Less re-keying. A clearer trail from tender to delivery to payroll preparation.

Yesterday's work becomes signed, payroll-ready evidence

The workflow mirrors the job site: the employee records hours, signs, hands the phone to the supervisor, and the supervisor unlocks signature capture with a private four-digit PIN.

ON-SITE HANDOFF

Two signatures. One phone.

No supervisor password swap and no need to wait until everyone is back in the office.

REMOTE OPTION

Approvals follow the supervisor.

If they are not together, the nominated approver receives an in-app action.

ACCOUNTING BOUNDARY

Prepared for Xero or MYOB.

Approved time is mapped and staged while payroll calculation stays with the accounting system.

Pre-starts that fit the fleet - not the other way around

Start with a practical generic checklist, then let administrators tailor questions for excavators, rollers, trucks or specialist equipment without losing version control.

READY OUT OF THE BOX

A useful generic pre-start.

Walk-around, cabin controls, alarms, attachments, defects and lock-out/tag-out are included.

CONFIGURABLE

Match checks to real plant.

Admins control sections, guidance, required questions and which answers trigger defects.

SAFER STATUS

Unsafe means unavailable.

Defect-triggering answers cannot pass; out-of-service status updates the plant record immediately.

Safety evidence that follows the workforce

Toolbox talks, SWMS, JSA and risk documents move through a controlled lifecycle: approved, published, assigned, read and signed.

Turn a tender pack into an actionable bid plan

Upload common tender files and surface source-linked requirement suggestions, then convert them into an owned submission checklist.

FIND THE OBLIGATIONS

Bring key clauses forward.

Surface likely submission, compliance, safety, commercial and program requirements.

KEEP CONTROL

People confirm the meaning.

Every suggestion is reviewable and links back to the document source.

DRIVE READINESS

Turn findings into action.

Assign owners, dates and completion status before the deadline.

The project record connects field, safety and commercial teams

Daily reports, labour, plant, quantities, delays, visitors, incidents, variations and progress claims share the same project context.

FIELD DELIVERY

A daily account of the work.

Capture personnel, plant, activities, quantities, weather, delays, visitors and photos.

COMMERCIAL CONTROL

Evidence beside the claim.

Variations and progress claims sit alongside the operational history that supports them.

MANAGEMENT VIEW

One project, multiple lenses.

Role-based access gives workers, supervisors, managers, payroll and safety teams focused views.

PROJECT-CENTRED

The project is the common thread connecting cost codes, hours, plant, safety, delivery and commercial records.

AUDIT-ORIENTED

Important workflow actions produce an organisation-scoped history with actor and time.

Built for how civil contractors actually work

OFFLINE-AWARE

Connectivity should not decide whether work is captured.

Tenant-owned devices, redacted changes and opaque cursors establish the safe sync foundation.

AUSTRALIA-FOCUSED

Local operating context matters.

Australian jurisdictions, WHS evidence and payroll integration boundaries shape the model.

INTEGRATION-READY

Avoid accounting lock-in.

Provider-neutral export batches keep TirGeo independent of Xero or MYOB.

ROLE-CONTROLLED

Give each person the right job.

Owners, admins, supervisors, safety, payroll, workers and auditors have distinct responsibilities.

TRACEABLE

Know who did what.

Signatures, content hashes, validated transitions and audit events preserve workflow context.

DEPLOYABLE FOUNDATION

Release controls are part of the product.

Migrations, Docker, CI, readiness checks and graceful shutdown support repeatable delivery.

TirGeo supports evidence and workflow. Payroll calculations, tax, superannuation, STP lodgement and legal entitlement remain with accredited systems and qualified advisers.

One connected backend, clear integration boundaries

Current backend wiring and integration boundaries

HARDENED FOUNDATION

Working, guarded backend workflows.

Tenant isolation, validated time, signed corrections, plant clearance, retryable exports, migrations, CI and safe sync metadata.

DELIVERY ROADMAP

Transparent about what comes next.

Live Xero/MYOB OAuth, push delivery, atomic offline replay, managed object storage, broader APIs and reporting.

From bid requirements to job-site evidence to payroll preparation - one operational thread.
